**Wind Turbine Drivetrain Diagnostics Simulator**

**An Ideal Apparatus for Wind Turbine Reliability Studies**

SpectraQuest’s Wind Turbine Drivetrain Diagnosis Simulator (WTDS) has been designed to simulate wind turbine drivetrains for experimental and educational purposes. The drivetrain consists of a 1 stage planetary gearbox, a 2 stage parallel shaft gearbox with rolling bearings, a bearing loader, and a programmable magnetic brake. All elements of the WTDS have been designed to maximize the number of drivetrain configurations to investigate gearbox dynamics and acoustic behavior, health monitoring, vibration based diagnostic techniques, lubricant conditioning or wear particle analysis. It is robust enough to handle heavy loads and spacious enough for easy gear placement, setup, and installation of monitoring devices. The two-stage parallel shaft gearbox can be configured as to reduce or increase the gear ratio. The planetary gear train, sun, planet and ring gears, the carrier, and bearings are all easily accessible.

**Flexible Drivetrain Fault Diagnostics**

The effect faults like surface wear, crack tooth, chipped tooth and missing tooth can be demonstrated on either spur gears or helical gears. Rolling element bearing faults like inner race, outer race, ball damage can also be incorporated. Adjustable clearance to study backlash is possible: increasing the amount of backlash is without major consequence (other than increased noise and rotational play), and reducing backlash can result in binding and/or excessive operating temperatures. Drivetrain misalignment can also be introduced intentionally in the WTDS. Any of these faults can be added to the drivetrain one at a time, or simultaneously to study fault interactions. Both torsional and radial loadings can be applied to study damage signature or propagation in gears and/or bearings: the torsional load is applied via a 3 HP variable frequency AC drive with a programmable, user-defined speed profiles; and the radial load is applied to a shaft in the parallel gearbox. With the programmable magnetic brake, rapid load fluctuation can be applied to simulate real life loading conditions experienced by wind turbines.

**Features:**

- 1-stage planetary gearbox and 2-stage oil-lubricated parallel shaft gearbox
- Gears can slide along the shafts to alter system stiffness and make room for additional devices.
- Adaptable to spur or helical gears.
- Intentionally damaged or worn gearing can be fitted to study the effects on vibration signature.
- Alterable backlash by replacing bearing mounting hubs to provide the desired clearance.
- Modular design makes the introduction of faulted bearing and/or faulted gears an easy task.
- Multiple mounting locations provided for installation of various transducers.
- Develop diagnosis techniques and advanced signal processing methods.
- Torsional and radial variable speed loading
- PC controlled magnetic brake connected directly to output shaft to provide loading
The WTDS is Heavy-Duty and Easily Configurable
The WTDS design enables changing gearbox and bearing components quickly and easily. The unit is adaptable to install either rolling element bearings with either spur or helical gears. The modular design makes the introduction of faulted bearing and/or faulted gears an easy task. Multiple mounting locations are provided for installation of transducers. The motor, gearboxes, brake are mounted on a half inch aluminum plate with stiffeners and vibration isolators to minimize environmental vibration.

Transducers and DAQ
The drivetrain is designed to accommodate different types of sensors easily. Accelerometers can be installed on the gearboxes and on the bearing housing to measure the vibrations in all three directions. A torque meter enables precise load measurement. The input and output shafts can be fitted with encoder or tachometer to measure the transmission error or for time synchronize averaging. Other transducers can also be installed per customers’ request. Data acquisition hardware and software are also available from Spectra Quest and ready to do time domain and frequency domain signal analysis.
Basic WTDS Configuration and Option Kits

The WTDS provides a basic setup for performing drivetrain experiments and for learning vibration signatures of gearbox and bearing malfunctions. However, a detailed investigation of particular and more advance vibration phenomena will require additional attachments and fixtures which are available through optional kits.

### Basic WTDS Configuration (WTDS2010)

- 3 HP Variable frequency AC drive with multi-featured front panel programmable controller, 220 VAC 1 phase supply
- 3 Phase 3 HP motor, pre-wired self-aligning mounting system for easy installation/removal
- Built-in tachometer with LCD display and one pulse per revolution analog TTL output for DAQ purposes
- 1 stage planetary gearbox with 4.7:1 gear ratio, planetary gear with 3 planets
- 2 stage parallel shaft gearbox with three in-line parallel shafts configurable as single or two stage reduction/increaser
- Four Spur Gears to obtain two gear mesh frequencies and three shaft speeds in parallel gearbox
- Six rolling element bearings in parallel gearbox
- Programmable Heavy duty magnetic brake (780lb-in) with power supply for gearbox loading
- Wind turbine simulator consisting of a tower, three blades with PC programmable variable pitch system, direct coupled system to connect blades to gearbox brake-end or chain driven system to connect blades
- Precision machined bearing housings at both ends of the gearbox with mountings for direct measurements of bearing vibration
- Parallel gearbox oil level gauge
- 1/2” die cast aluminum base, base stiffener and eight rubber isolators
- Comprehensive operations manual

### Parallel Gearbox Bearing Fault Kit (W-BFK-1)

- Learn waveform and spectra of classic bearing defects.
- Learn about signal processing issues such as averaging techniques, leakage, and spectral resolution on determining bearing faults.
- Perform experiments with increasing severity of defects.
- Determine why an ultra-high resolution spectrum is needed to diagnose a bearing fault when fault frequencies are located close to multiples rotational speed.
- Learn how a large signal can mask adjoining low amplitude signal due to spectra leakage.
- **The kit consists of one inner race defect, one outer race defect, one with ball defect, and one combination of defects.**

### Planetary Gearbox Bearing Fault Kit (W-BFK-P)

- Study bearing faults in planetary gearbox
- **The kit consists of two different levels of inner race fault and two different levels of needle fault.**
### Wind Turbine Drivetrain Diagnostics Simulator

#### Radial Bearing Loader (W-RBL)
- Investigate bearing radial loading effects.
- Understand bearing failure signature as a function of load and rotational speed.
- Compare vibration signature between loaded and unloaded bearings.
- Study outer race bearing fault signature as a function of load location.
- The kit consists of one mechanical bearing loader.

#### Defective spur gears (W-SDG)
- Study the effect of damaged tooth in gearboxes.
- Apply phase demodulation signal analysis to detect gear damage.
- Investigate backlash between mating gears.
- The kit consists of one missing tooth gear, one chipped tooth gear, one root crack gear, and one surface wear gear.

#### Defective planetary gears (W-PDG)
- Study the effect of damaged planetary gears.
- Apply phase demodulation signal analysis to detect gear damage.
- The kit consists of one missing tooth gear, one chipped tooth gear, one root crack gear, and one surface wear gear.

#### Eccentric spur gear (W-ESG)
- Study the effects of eccentric spur gear.
- Measure the vibration signature of eccentric gears.
- The kit consists of one eccentric spur gear.

#### Helical gears set (W-HG)
- Study the helical gears parallel shaft gearbox.
- Compare vibration signature between spur and helical gears.
- The kit consists of four helical gears to replace standard spur gears in gearbox.

#### Defective helical gears (W-HDG)
- Study the effect of damaged helical gears.
- Apply phase demodulation signal analysis to detect gear damage.
- The kit consists of one gear with chipped tooth, one gear with missing tooth and one gear with surface defect.
- Requires G-HG.
**Wind Turbine Drivetrain Diagnostics Simulator**

**Torque transducer with built encoder on input shaft (W-TOR)**
- Measure the torque on the input shaft.
- Study torque variation through full rotation cycle.
- Track shaft position in signal analysis.
- **The kit consists of one 20 N.m torque meter with built-in 360 pulse encoder**

**Shaft encoder (W-ENC)**
- Measure transmission error in the gearbox by comparing input and output rotation.
- **The kit consists of one 360 pulse per revolution encoder and one per revolution index**

**PC Motor Control Kit (W-PCMK)**
- Operate WTDS from remote location.
- Pre-program speed acceleration, deceleration, and length of run to meet exact requirements.
- **The kit consists of PC software, one interface module to motor drive and cables.**

**PC Load Control Kit (W-PCLK)**
- Operate magnetic brake and wind turbine blade pitch from remote location.
- Pre-program load profiles of run to meet exact requirements.
- **The kit consists of PC software, one interface module to magnetic brake and cables.**

**Radial Bearing Loader Force Transducer (W-RBFT)**
- Measure the radial load applied by the mechanically operated bearing loader.
- **The kit consists of one transducer measuring radial force and one matching signal conditioner.**
- Requires W-RBL
High Value Combination Packages

The WTDS is also available in high value combination packages. From basic to comprehensive, each package is designed to provide you with all the tools needed to study a variety of wind turbine drivetrain fault topics.

**Package No. 1:** Basic WTDS + Kits for in-depth studies of wind turbine drivetrain diagnostics

**Package No. 2:** Basic WTDS + Kits in-depth studies of wind turbine drivetrain diagnostics with instrumentation

**Package No. 3:** Basic WTDS + Kits in-depth studies of wind turbine drivetrain diagnostics with instrumentation plus torque transducer and encoders

**Turnkey Package**

SpectraQuest simulators and software are conveniently sold as comprehensive training packages. The purchase of a training package provides you with all of the components necessary, such as sensors, data acquisition and analysis software, for a fully functional, turnkey training system.

- Accurate machinery problem assessment and identification as to root cause
- Improve process and machinery reliability and satisfy ISO and QS expectations
- Practice and experiment in laboratory environment to accelerate the learning process
- **Turnkey Training Package 7:** Wind Turbine study complete system. Includes: WTDS Package 2(WTDS2010-PK2), four accelerometers (SQI604/4), 8 channel desktop DAQ (VQ-DT8)
**SpectraQuest: A Valuable Resource for Keeping Companies Productive**

SpectraQuest offers a wide range of optional tool kits for productivity enhancement. We also continue to develop new applications and improvements for the WTDS so that the investment you make in this important training tool will continue to provide value for many years to come. To learn more about the WTDS and how it can help you to keep your plant operating profitably, please call or e-mail us.

*The WTDS was designed to simulate wind turbine drivetrains for experimental and educational purposes*
